# ACTIVATING AN ELECTRICAL OUTLET WITH THE CARD

All the terminals and sockets in the port are identified with the correspondence of the station. For example, for substation **1133**, this is distribution point **4 of the 11/09 terminal; The terminal does not necessarily have the same number as the place number.**

The same applies to the water distribution point. For square **1133**, the water distribution point is **4 of the 11/09 marker.**

The first step is to **connect** the socket to the charging station.

The card must then **be presented in front of** the reader

A **beep sounds** when the outlet is ready to be activated. **A press** of the push button above the socket activates **it**.

Your ship is **now connected.** You can now use the electricity from your **personal account**. To log out, you can either **hold the** card and **press** the button or **remove** the plug, which **will automatically disconnect** it.
